

Levo Sulbutamol Sulphate

Levo Sulbutamol Sulphate is the *R*-enantiomer of the short-acting β_2 -adrenergic receptor agonist salbutamol.

As a bronchodilator, it is used to treat asthma and chronic obstructive pulmonary disease (COPD). In general, levosulbutamol has similar pharmacokinetic and Pharmacodynamic properties to salbutamol; however, its manufacturer, Sepracor, has implied (although not directly claimed) that the presence of only the *R*-enantiomer produces fewer side effects.
